1. Abstract

Prostate cancer is one the common cancers affecting older men. Some prostate cancers are less aggressive and confined to prostate gland only whereas some prostate cancers are aggressive and can metastasize fast, these type of prostate cancers need surgical intervention for better prognosis. The development of laparoscopic radical prostatectomy has been one of the surgical advances in the treatment of localized prostate cancer. The procedure aims to combine the advantages of minimally invasive surgery with resection based on established oncological principles with cure rates when compared to open surgery.
